SimpleRandomSample

I collected my simple random sample at my local Whole Foods parking garage in Coral Gables. Since the parking lot was full, I thought it was the perfect place to collect my sample. I chose a random car to record, then used a random number generator to decide how many cars across I should go, then generated another random number to decide how many rows to go down. That car would then be the one to sample. Then, I repeated this process until I had ten randomly selected cars.
